HIGH-FLUX XUV BEAM LINES

Sources of short-wavelength radiation, such as synchrotrons or free-electron lasers, have already enabled numerous applications and will facilitate more seminal studies. On the other hand, sources of coherent extreme ultraviolet to soft x-ray radiation via high-harmonic generation (HHG) of ultrashort-pulse lasers have gained significant attention in the last years due to their enormous potential to address a plethora of applications in a cost-effective and table-top format. Therefore, they constitute a complementary source to large-scale facilities.

The photon-flux values obtained by Fiber-laser-driven HHG sources can be considered the highest of all laser systems for photon energies between 20-150 eV.

AFS ultrafast fiber lasers are ideal high-harmonic drivers. These turnkey HHG beamlines can address several applications in the EUV to X-ray spectral region such as:

- Photoelectron spectroscopy
- Coherent diffractive imaging – CDI (nanoscope)
- Attosecond science

HIGH-FLUX XUV BEAM LINES

Photon energy	21 eV	90 eV
Wavelength	59 nm	13 nm
Photon flux per harmonic	up to 10^{14} s^{-1}	up to $5 \cdot 10^{10} \text{ s}^{-1}$
Average power per harmonic	up to 330 μW	up to 0.7 μW
Repetition rate	flexible, up to 10 MHz	
Pulse duration	The pulse duration is smaller than the laser pulse duration i.e. < 30 fs (or shorter)	
Relative bandwidth of one harmonic	< 10^{-2}	< $7 \cdot 10^{-3}$
Beam profile	Gaussian	
Dimensions of HHG chamber	$80 \times 40 \times 40 \text{ cm}^3$	
Additional features	Turnkey reliability, high stability, all parameters software-controlled	
Add-ons	Single-harmonic selection, separation of XUV radiation and driving radiation	

Illustration of the HHG process

Typical emission-spectrum of a fiber laser driven HHG source
